

ADEGOKE ADEWALE IDRIS

AUTOMATION ENGINEER

Ilorin, Kwara State, Nigeria | Princeadewale391@gmail.com | +234-808-336-8552 | [LinkedIn](#) | [GitHub](#)

PROFESSIONAL SUMMARY

Automation-focused Full-Stack Developer with hands-on experience building systems that ingest, process, and act on data without manual intervention. Currently building an automated trading signal pipeline (Telethon, GROQ, Redis Streams) and shipped a real-time IoT telemetry platform (Django Channels, MQTT, Redis) handling high-volume, continuous data flows. Comfortable owning a system from architecture through deployment, with strong Python, Django, and REST API fundamentals.

AUTOMATION & SYSTEMS PROJECTS

Automated Trading Signal Pipeline | Independent Project — In Progress

- Designing and building a fully automated bot that ingests trading signals from WhatsApp and Telegram groups in real time and executes trades on a crypto prop-firm account with no manual step in the loop.
- Architected the system as a monorepo (Python 3.12) using Telethon for signal capture, the GROQ SDK for signal parsing/validation, Redis Streams for reliable event processing, and Supabase for persistence, deploying on a VPS (Hetzner/Contabo).
- Telegram ingestion is implemented and functional; WhatsApp ingestion and full trade-execution automation are in active development.

Real-Time IoT Telemetry Platform ("IoT Bridge") | Independent Project

- Built an industrial IoT platform automating the ingestion, processing, and live visualization of device telemetry, using an MQTT bridge, Django Channels, and Redis for real-time WebSocket delivery.
- Optimized the OHLC telemetry endpoint for high-volume data streams, engineering the pipeline toward a theoretical ceiling of ~50,000 rows/second.
- Implemented Redis read-through caching for device authentication to reduce redundant database load under continuous device polling.
- Delivered a React/TypeScript frontend with live candlestick charting and WebSocket-driven telemetry updates, closing the loop from raw device data to real-time dashboard.

Telegram Caption Automation Bot | Client Project (Freelance)

- Automated a previously manual social-media captioning workflow using Python/FastAPI and python-telegram-bot in webhook mode, with GROQ vision models generating captions from images.
- Added a two-step validation call before caption generation to automatically catch and filter bad outputs without human review.

WORK EXPERIENCE

Full-Stack Developer | Freelance, Remote (Entercom Security)

Mar 2023 – Present

- Building a field service management and customer operations platform end-to-end: Django REST Framework backend, Expo React Native mobile app, and React web frontend.
- Designed role-based access (staff, technician, customer) with JWT authentication and audit logging.
- Integrated Paystack payment gateway for billing and subscription management.

Engineering Intern | Pronto Microsystems Technology Limited, Lagos, Nigeria

Aug 2025 – Sept 2025

- Developed and deployed full-stack solutions using Django, Flask, and React; designed secure REST APIs and managed SQL databases.
- Optimized application performance through debugging, tuning, and CI/CD workflow improvements.

Data Analyst (Crypto Markets) | Prebit Telegram, Remote

Dec 2024 – Jul 2025

- Analyzed cryptocurrency market data using statistical and technical models to generate trading signals for perpetual contracts.
- This work directly informed the design of the automated signal pipeline listed above.

SKILLS

Automation & Data Pipelines: Telethon, Redis Streams, MQTT, WebSockets (Django Channels), event-driven pipeline design

Languages & Frameworks: Python, JavaScript/TypeScript, C, Django, Django REST Framework, Flask, React, React Native (Expo)

Data & Cloud: PostgreSQL, SQL, SQLite, Redis, Supabase, Render, Heroku, Hetzner/Contabo VPS

Tools & Practices: Git, REST APIs, CI/CD, JWT auth, GROQ SDK/LLM API integration, cybersecurity fundamentals

EDUCATION

B.Eng. Computer Engineering | University of Ilorin, Nigeria

2021 – *Expected 2026*

- Coursework: Software Engineering, Data Structures, Embedded Systems, AI, Digital Electronics.

CERTIFICATIONS

- CS50: Introduction to Computer Science — HarvardX (EDX), 2023
- CS50: Web Programming with Python and JavaScript — HarvardX (EDX), 2022
- Cyber Security Training — NITDA, Oct 2023
- Python Programming — Programming Hero, 2023
- Web Development — Programming Hero, 2022
- Data Analysis — MSSN, University of Ilorin Chapter, 2022
